Basic StatisticS 1. Create a data frame for the table below.

```
scores <- data.frame(
          Student = seq(1:10),
          Pre_test = c(55, 54, 47, 57, 51, 61, 57, 54, 63, 58),
          post_test = c(61, 60, 56, 63, 56, 63, 59, 56, 62, 61)
          )
scores
```

```
##    Student Pre_test post_test
## 1        1       55        61
## 2        2       54        60
## 3        3       47        56
```

```
## 4        4       57        63
## 5        5       51        56
## 6        6       61        63
## 7        7       57        59
## 8        8       54        56
## 9        9       63        62
## 10      10       58        61
```

```
colnames(scores) <- c("Student", "Pre-test", "Post-test")
scores
```

```
##    Student Pre-test Post-test
## 1        1       55        61
## 2        2       54        60
## 3        3       47        56
## 4        4       57        63
## 5        5       51        56
## 6        6       61        63
## 7        7       57        59
## 8        8       54        56
## 9        9       63        62
## 10      10       58        61
```

a. Compute the descriptive statistics using different packages (Hmisc and pastecs). Write the codes and its result. HMISC

```
dsHmisc <- describe(scores)
dsHmisc
```

```
## scores

```

2. The Department of Agriculture was studying the effects of several levels of a fertilizer on the growth of a plant. For some analyses, it might be useful to convert the fertilizer levels to an ordered factor.The data were 10,10,10, 20,20,50,10,20,10,50,20,50,20,10.

```
data <- c(10,10,10, 20,20,50,10,20,10,50,20,50,20,10)
```

a. Write the codes and describe the result

```
factor(data)
```

```
##  [1] 10 10 10 20 20 50 10 20 10 50 20 50 20 10
## Levels: 10 20 50
```

```
sort(data, decreasing = FALSE)
```

```
##  [1] 10 10 10 10 10 10 20 20 20 20 20 50 50 50
```

```
#The result displays the differerent levels of fertilizer in an ordered or increasing manner.
```

3. Abdul Hassan, president of Floor Coverings Unlimited, has asked you to study the exercise levels undertaken by 10 subjects were “l”, “n”, “n”, “i”, “l” , “l”, “n”, “n”, “i”, “l” ; n=none, l=light, i=intense

```
exerciseLevels <- c("l", "n", "n", "i", "l", "l", "n", "n", "i", "l")
```

a. What is the best way to represent this in R?

```
exerciseLevels
```

```
##  [1] "l" "n" "n" "i" "l" "l" "n" "n" "i" "l"
```

```
factor(exerciseLevels)
```

```
##  [1] l n n i l l n n i l
## Levels: i l n
```

```
# They are best respresented through data.frame.
```

4. Sample of 30 tax accountants from all the states and territories of Australia and their individual state of origin is specified by a character vector of state mnemonics as:

```
state <- c("tas", "sa", "qld", "nsw", "nsw", "nt", "wa", "wa", "qld",
             "vic", "nsw", "vic", "qld", "qld", "sa", "tas", "sa", "nt",
             "wa", "vic", "qld", "nsw", "nsw", "wa", "sa", "act", "nsw",
             "vic", "vic", "act")
state
```

```
##  [1] "tas" "sa"  "qld" "nsw" "nsw" "nt"  "wa"  "wa"  "qld" "vic" "nsw" "vic"
## [13] "qld" "qld" "sa"  "tas" "sa"  "nt"  "wa"  "vic" "qld" "nsw" "nsw" "wa"
## [25] "sa"  "act" "nsw" "vic" "vic" "act"
```

a. Apply the factor function and factor level. Describe the results.

```
factorState <- factor(state)
factorState
```

```
##  [1] tas sa  qld nsw nsw nt  wa  wa  qld vic nsw vic qld qld sa  tas sa  nt  wa
## [20] vic qld nsw nsw wa  sa  act nsw vic vic act
## Levels: act nsw nt qld sa tas vic wa
```

```
factorLevel <- levels(factorState)
factorLevel
```

```
## [1] "act" "nsw" "nt"  "qld" "sa"  "tas" "vic" "wa"
```

```
#The factor() function displays the vector and its levels.
#The levels() function simple displays the levels or differenct characters the have been used.
```

5. From #4 - continuation: Suppose we have the incomes of the same tax accountants in another vector (in suitably large units of money)

```
incomes <- c(60, 49, 40, 61, 64, 60, 59, 54, 62, 69, 70, 42, 56, 61, 61,
             61, 58,51, 48,  65, 49, 49, 41, 48, 52, 46, 59, 46, 58, 43)
incomes
```

```
##  [1] 60 49 40 61 64 60 59 54 62 69 70 42 56 61 61 61 58 51 48 65 49 49 41 48 52
## [26] 46 59 46 58 43
```

```
data2 <- data.frame(
  state = c("tas", "sa", "qld", "nsw", "nsw", "nt", "wa", "wa", "qld",
            "vic", "nsw", "vic", "qld", "qld", "sa", "tas", "sa", "nt",
            "wa", "vic", "qld", "nsw", "nsw", "wa", "sa", "act", "nsw",
            "vic", "vic", "act"),
  incomes = c(60, 49, 40, 61, 64, 60, 59, 54, 62, 69, 70, 42, 56, 61, 61,
            61, 58,51, 48,  65, 49, 49, 41, 48, 52, 46, 59, 46, 58, 43)
)
data2
```

```
##    state incomes
## 1    tas      60
## 2     sa      49
## 3    qld      40
## 4    nsw      61
## 5    nsw      64
## 6     nt      60
## 7     wa      59
## 8     wa      54
## 9    qld      62
## 10   vic      69
## 11   nsw      70
## 12   vic      42
## 13   qld      56
## 14   qld      61
## 15    sa      61
## 16   tas      61
## 17    sa      58
## 18    nt      51
## 19    wa      48
## 20   vic      65
## 21   qld      49
## 22   nsw      49
## 23   nsw      41
## 24    wa      48
## 25    sa      52
## 26   act      46
## 27   nsw      59
## 28   vic      46
```

```
## 29   vic      58
## 30   act      43
```

a. Calculate the sample mean income for each state we can now use the special function tapply():

```
tapply(incomes, state, mean)
```

```
##      act      nsw       nt      qld       sa      tas      vic       wa
## 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000
```

b. Copy the results and interpret.

```
tapply(incomes, state, mean)
```

```
##      act      nsw       nt      qld       sa      tas      vic       wa
## 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000
```

```
# It displays the levels of the vector and their corresponding mean.
```

6. Calculate the standard errors of the state income means (refer again to number 3)

a. What is the standard error? Write the codes.

```
stdError <- function(x) sqrt(var(x)/length(x))
incster <- tapply(incomes, state, stdError)
incster
```

```
##      act      nsw       nt      qld       sa      tas      vic       wa
## 1.500000 4.310195 4.500000 4.106093 2.738613 0.500000 5.244044 2.657536
```

b. Interpret the result.

```
# The result displays the sample distribution's standard deviation or an estimate of the SE.
# It displays the levels and their corresponding SD.
```

7. Use the titanic dataset.

```
data("Titanic")
TitanicDF <- as.data.frame(Titanic)
TitanicDF
```

```
##    Class    Sex   Age Survived Freq
## 1    1st   Male Child       No    0

c. Compute the descriptive statistics using different packages. Find the values of: c.1 Standard error of the mean for clump thickness.

```
SDclump <- sd(BreastCancer$`CL. thickness`/sqrt(length((BreastCancer$`CL. thickness`))))
SDclump
```

```
## [1] 0.4092884
```

c.2 Coefficient of variability for Marginal Adhesion.

```
CVmarg <- sd(BreastCancer$`Marg. Adhesion`) / mean(BreastCancer$`Marg. Adhesion`) * 100
CVmarg
```

```
## [1] 97.67235
```

c.3 Number of null values of Bare Nuclei.

```
NumberbareNuc <- sum(is.na(BreastCancer$`Bare. Nuclei`))
NumberbareNuc
```

```
## [1] 0
```

c.4 Mean and standard deviation for Bland Chromatin

```
MeanBland <- mean(BreastCancer$`Bl. Cromatin`)
MeanBland
```

```
## [1] 3.836735
```

```
SDBland <- sd(BreastCancer$`Bl. Cromatin`)
SDBland
```

```
## [1] 2.085135
```

c.5 Confidence interval of the mean for Uniformity of Cell Shape

```
MeanCell <- mean(BreastCancer$`Cell Shape`)
SDCell <- sd(BreastCancer$`Cell Shape`)/sqrt(length(BreastCancer$`Cell Shape`))

alpha <- 0.05
dg <- length(BreastCancer$`Cell Shape`) - 1

t.score <- qt(p = alpha/2 , df = dg, lower.tail = F)

margin.error <- t.score * SDCell
lower.bound <- MeanCell - margin.error
upper.bound <- MeanCell + margin.error

CFinterval <- c(lower.bound, upper.bound)
CFinterval
